

The HTML iframe

The <iframe> tag specifies an inline frame.

An inline frame is used to embed another document within the current HTML document.

One of the most common uses is to embed YouTube video.

Choose Share > Embed and click more to see options. All you need to do now is to select the generated code and paste it into your HTML.

The code to be inserted is.

```
<iframe width="560" height="315"  
src="https://www.youtube.com/embed/izbry0qk8LU?rel=0&showinfo=0"  
frameborder="0" allowfullscreen></iframe>
```

Another use can be to open up a separate HTML window within an HTML page. Try this example. You can download `iframe_image.html` from Moodle as a starting point.

```
<iframe src="iframe_image.html" name="iframeA" width="600"
height="480" frameborder="0" ></iframe>
```

```
<a href=http://www.w3schools.com target="iframeA">W3Schools.com</a>
```

```
<p>Because the target of the link matches the name of the iframe,
the link will open in the iframe.</p>
```
